hyperMILL®
for Autodesk® Inventor®
Efficient and reliable machining

*hyperMILL*® is one of the world’s most powerful CAM solutions for machine- and controller-independent programming. The system provides extremely innovative, flexible and powerful CAM strategies that allow manufacturers to achieve quality, time and cost targets much more quickly, even on challenging parts.

Surfaces and edges are visibly smoother, cleaner and more precise. This is high-precision machining in a nutshell. Even hard-to-reach areas can be machined safely thanks to the reliable collision avoidance function. *hyperMILL*® gives users the security of knowing that they can manufacture new components quickly and flexibly.

**Seven reasons to choose hyperMILL®:**

1. Future-proof investment
2. Top performance
3. Easy to use
4. Efficient and reliable processes
5. Optimised workflow
6. Superb quality
7. Everything can be automated
Increased performance

Speed is more crucial than ever these days. hyperMILL® MAXX Machining allows you to significantly reduce machining times.

The hyperMILL® MAXX Machining performance package comprises three separate modules for highly efficient roughing, finishing and drilling. Trochoidal toolpaths ensure extremely fast material removal. Innovative strategies for barrel cutters, also known as circle segment end mills, allow extremely fast finishing with equivalent or significantly higher surface qualities. Milling tools tilted in the cutting direction can drill holes quickly and easily, even in materials that are difficult to machine and without the need for a predrilled hole.

More safety during machining

Better safe than sorry! This is what the fully automatic collision checking and avoidance are for. hyperMILL® detects collisions and provides powerful solutions for avoiding collisions during 2.5D, 3D and 5axis machining. A collision-free tool angle is calculated automatically for 5axis simultaneous machining. The user can decide which axis of rotation should be prioritised in collision avoidance depending on the machine kinematics.

“We look for and find unique strategies for efficient machining.”

Dr. Josef Koch, CTO, OPEN MIND Technologies AG
Powerful CAM strategies

2.5D machining
hyperMILL® 2.5D machining is typically used for plate processing in tool and mould manufacturing where there are numerous pockets, plane levels, contours and drill holes. Intelligent mechanisms – that detect pocket and drill features, for example – speed up programming even further.

3D machining
hyperMILL® offers powerful and precise functions for 3D milling. It allows users to manufacture high-quality surfaces quickly and reliably, even with complex workpieces. Numerous strategies for roughing and finishing ensure efficient 3D machining.

5AXIS machining
5-axis machining from hyperMILL® is ideal for working with challenging geometries, free-form surfaces and deep cavities. It is significantly more efficient than 3-axis technology. hyperMILL® offers a wide range of powerful 5-axis strategies for simultaneous and indexed roughing and finishing, which allows users to produce top-quality surfaces.

5AXIS special applications
Mit den Paketen für das Bearbeiten von Impellern und Blisks, With packages for machining impellers, blisks, turbine blades, tubes and tire moulds, hyperMILL® offers solutions for the complete machining of complex part geometries. Intelligent automated functions, optimised milling strategies and a simple workflow allow even users without special expertise to reliably and effectively program cycles.

Mill turning
A single CAM solution allows easy programming of milling and turning cycles in one setup on the mill/turn machine. Mill turning is completely integrated into hyperMILL®. This allows the tool data-base, stock tracking, collision checking and postprocessors to be used jointly for all milling and turning operations.

Measuring
Internal process quality control on the CNC machine tool is becoming increasingly important. This is why hyperMILL® also features measurement cycles that provide the necessary in-process measurement data.
Single database
Integration facilitates continuous processes thanks to a unified database. Both the CAD and CAM systems use the same data model.

Programming
Numerous machining strategies are available in a single user interface for the user to quickly and reliably program CAM cycles. Users do not need to switch between two or more programs, which in turn simplifies operation, offers more ease of use and ensures the highest programming reliability possible.

Automating
Users can automatically program drill holes, pockets, variants and part families right away using the sophisticated feature and macro technology. The automation technology from OPEN MIND is one of the most advanced in the world and fulfils all requirements. Our experts can create tailored solutions – to fully automate processes or connect a process to an API interface, for example.

Simulating
The precise machine and material removal simulation allows users to quickly and dynamically check tool movements. The machine simulation feature in hyperMILL® allows users to verify that processes are safe before the final NC program is created. In addition, hyperMILL® VIRTUAL Machining Center allows users to create a simulation that is based on the NC code. The collision check takes place after each post-processor run – that is, directly in the generated NC program – ensuring maximum process safety.

Machining
High performing part programs and optimised postprocessors mean that hyperMILL® ensures safe manufacturing processes. Thanks to reliable collision checking and avoidance, the 5axis machining of complex components is just as reliable as the machining of 3D tasks.

Managing
It is necessary today for process and component data to be managed centrally. hyperMILL® fulfils this requirement by providing interfaces for leading product lifecycle management systems: ENOVIA, Teamcenter and Windchill.
At home in all sectors

**hyperMILL® for Autodesk® Inventor®** – for efficient and reliable CAM programming

Whether you work with simple or highly complex components, hyperMILL® allows you to significantly reduce your programming and machining times. The results fulfil our customers' most demanding requirements on precision, reliability, surface quality and machining time.

**Unique CAM strategies that are easy to operate**

hyperMILL® is a modular and flexible CAM solution for 2.5D, 3D and 5axis milling as well as mill turning and machining operations such as high-speed cutting (HSC) and high-performance cutting (HPC). The special applications for milling impellers, blisks, turbine, blades and tubes round off the range of functions available in hyperMILL®.

**Optimised postprocessors**

Powerful right up to program output. We consider postprocessor technology to be one of our core competencies. That’s why we develop all postprocessors and perfectly tailor them to the machines.

WE PUSH MACHINING TO THE LIMIT.

**Global success**

Our customers come from all around the world and from a range of sectors, including engineering, tooling, prototyping and mould manufacturing as well as the motor sports, aerospace, energy, medical industries, and watches and jewellery sectors, to name but a few. Users appreciate the significant cost savings and increases in efficiency in addition to the excellent machining results.
The Autodesk® Inventor® 3D CAD system provides engineers with a complete set of tools that enables them to develop innovative 3D products and bring them to the market in the shortest time possible. hyperMILL® integration means that Autodesk® Inventor® users can also use one of the most powerful CAM systems for machine- and controller-independent programming during manufacturing.

**Seamless CAD integration**

hyperMILL® has been certified by Autodesk® for Inventor® and therefore fulfills the highest requirements regarding integration, reliability and user-friendliness. This means that companies can very easily integrate hyperMILL® into existing process chains.

**Features**

- Seamlessly integrated with Autodesk® Inventor®
- Familiar user interface
- A single file for CAD and CAM data
- Detection of geometry features
- Long-standing certified partner

**One-window solution**

hyperMILL® is launched directly via the hyperMILL® button in Autodesk® Inventor®. Users can freely switch between the CAD and the CAM tabs at any stage.

**Take advantage of geometry features**

hyperMILL® feature technology allows you to use in Autodesk® Inventor® existing CAD features. For example, automatic feature recognition allows you to detect holes, threads and pockets on solid and face models.
